Valuation Intelligence, Scenario Testing
& Approach Selection

PT Darma Henwa Tbk / IDX:DEWA

Business Valuation Midterm
A self-contained valuation study

vista-ariel-dewa.streamlit.app

Market reference: 19 October 2026 Financial position: 30 September 2026

Ariel Arviano Putra / 29125401

Executive conclusion: Base value is Rp152.3

Rp152.3

Estimated blended value per share

Rp242

Market reference per share
19 October 2026

The model value is 37.1% below the reference price: (152.3 ÷ 242) − 1. This is a valuation gap, not a prediction that the share price will fall by that amount.

Provisional AVOID / REDUCE. Confidence is only 34/100 because the methods disagree and important inputs remain uncertain.

Sources: VISTA Base output; Stock Analysis DEWA price history; KSEI issued shares. Full references on slide 19.

How VISTA arrives at a value

Approach	What it measures	Role in this model
Market reference	The observed price investors pay	Rp242/share is the comparison point
FCFF DCF	Present value of future operating cash	Estimates fundamental operating value
Relative valuation	Value implied by comparable companies	Applies a peer EV/EBITDA multiple
Asset recovery	Recoverable nonoperating assets	Adjusts equity value, not a third blend

DCF and relative valuation receive suitability-based weights. Both methods convert enterprise value into equity value before dividing by the same share count.

Method: engine.py, dcf(), relative() and assess(). Asset recovery uses analyst assumptions because standalone mine economics are unavailable.

The study uses four filings and a fixed price

Input	Treatment in VISTA
FY2025 audited consolidated statements	Historical anchor and acquisition-gain adjustment
Q1, corrected Q2 and Q3 2026	Interim performance and 30 September balance sheet
19 October 2026 market price	Rp242/share, a fixed reference rather than live data
KSEI share count, 16 October 2026	40,687.434 million issued shares, including treasury shares

Reports use cumulative periods. A standalone Q3 figure equals nine-month results minus corrected six-month results. Each extracted input retains its file, page, unit and original value.

Sources: supplied financial statements; source_inputs.csv (187 records); model_inputs.json market section. Issued shares are not verified net diluted shares.

Restatement and reclassification have different effects

2024 restatement

The revised figures reduce assets and equity by Rp272.1bn and increase net profit by Rp38.9bn.

VISTA retains original and restated values separately to avoid comparing inconsistent historical figures.

2025 equity reclassification

Rp2,110.0bn moves between equity accounts. Total equity stays unchanged.

A change in account classification does not create new cash or increase the total value of equity.

Sources: FY2025 audited PDF pp.73–80; corrected Q2 PDF p.1; Q3 PDF pp.22–23. Page numbers refer to physical PDF pages.

Reported profit includes a large noncash gain

FY2025 other-income bridge	IDR bn
Acquisition gain	4,535.4
Writeoffs, disposals and loss of control	(723.8)
Residual other losses	(74.8)
Reported other income, net	3,736.8

Why normalization matters

The acquisition gain is not recurring cash from mining services. Repeating it in a forecast would overstate operating performance.

VISTA builds recurring EBIT of Rp722.3bn from operating components that already exclude the gain. It does not subtract the gain a second time. Reported net profit is Rp4,306.8bn.

Source: FY2025 audited PDF pp.29, 81 and 120. The table reconciles other income, not total net profit. EBIT means operating earnings before interest and income tax.

FCFF measures cash after operating investment

Step	Economic meaning
Operating profit after tax (NOPAT)	Cash earnings before financing costs
Add depreciation and amortization	Reverse expenses that do not use current-period cash
Subtract cash and lease capital expenditure	Fund equipment and other long-term operating assets
Subtract increase in working capital	Fund receivables and other net operating balances

The result is free cash flow to the firm (FCFF), available to lenders and shareholders. VISTA discounts future FCFF at WACC, the combined required return on debt and equity.

Source: VISTA engine and workbook DCF sheets. Terminal FCFF also funds reinvestment, so perpetual growth is not treated as cost-free.

Base forecasts assume gradual operating improvement

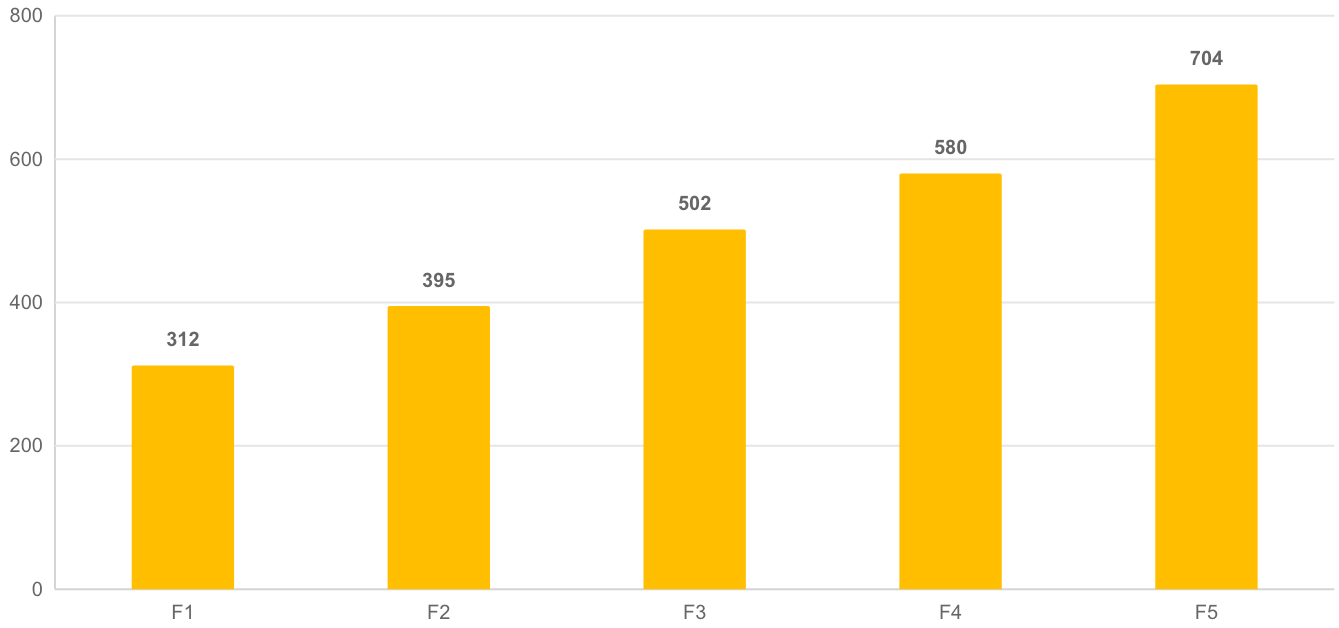

Assumption	F1	F2	F3	F4	F5
Revenue growth	8%	7%	6%	5%	4%
Operating margin	14%	14.5%	15%	15%	15%
Cash capex / sales	21%	20%	19%	18%	17%
Working capital / sales	12%	12%	12%	12%	12%

F1–F5 end in September 2027–2031. Starting revenue annualizes nine-month 2026 revenue by 4/3. These are analyst assumptions, not management guidance, and may miss seasonal effects.

Other Base inputs: tax 22%, lease capex 0.5% of sales, WACC 14%, terminal growth 3.5%, terminal ROIC 15%.

Source: model_inputs.json, Base assumptions. Depreciation / sales: 15.5%, 15%, 14.5%, 14%, 14%. ROIC is return on invested capital.

DCF depends heavily on cash beyond year five

72% of operating value

The present value of cash after F5 is Rp4,178.6bn, within total operating value of Rp5,803.8bn. Long-term assumptions therefore have a large influence.

Terminal FCFF = next-year NOPAT × (1 − g / ROIC). With g = 3.5% and ROIC = 15%, 23.3% of terminal NOPAT funds reinvestment. The remainder becomes FCFF.

Source: Base DCF output. Forecast FCFF is rounded to IDR bn. Cash flows use end-year discounting. Terminal growth must remain below WACC.

Operating value becomes Rp79.8 per share

Base equity bridge	IDR bn
Operating enterprise value	5,803.8
Less total debt	(6,276.6)
Add cash	744.9
Add recoverable investments	1,269.2
Add exploration recovery	1,720.4
Less noncontrolling interests	(15.2)
Equity value	3,246.5

From company to shareholder

Debt belongs to lenders, so it is deducted. Cash and recoverable nonoperating assets are added. Noncontrolling interests belong to other owners.

Rp3,246.5bn ÷ 40,687.434m shares × 1,000 = Rp79.8/share

Source: Base DCF bridge. Recovery assumptions: investments 90%, exploration 30% of net carrying value. Rounded components may not sum exactly.

Four core peers provide a market cross-check

Peer	EV/EBITDA	Reason for caution
PTRO	12.74×	EPC and offshore business mix
MYOH	0.80×	Net cash lowers enterprise value
DOID	7.91×	Leverage and foreign exposure
UNIQ	2.76×	Smaller operating scale
UNTR	3.73×	Diversified business, excluded from core median

EV means enterprise value. EBITDA is earnings before interest, tax, depreciation and amortization. The ratio compares company value with a pre-investment earnings measure. EBITDA is not free cash flow.

Sources: peer vendor Current/TTM snapshots and company-profile references in model_inputs.json. Reporting dates, leases and one-offs are not fully harmonized.

The peer median implies Rp209.1 per share

1. Calculate the core median

Sorted multiples: 0.80×, 2.76×, 7.91×, 12.74×. The median is (2.76 + 7.91) ÷ 2 = 5.335×. It limits the effect of extremes but cannot remove differences between businesses.

2. Apply it to DEWA earnings

Model EBITDA Rp2,073.8bn × 5.335 = enterprise value Rp11,063.9bn. The Base equity bridge deducts a net Rp2,557.3bn, giving equity value Rp8,506.6bn.

Rp8,506.6bn ÷ 40,687.434 million shares × 1,000 = Rp209.1/share. This is a peer-based estimate, subject to comparability limits.

Source: Base relative valuation output. Net bridge is the same debt, cash, recoverable assets and noncontrolling-interest adjustment used in Base DCF.

Suitability scores determine the blend

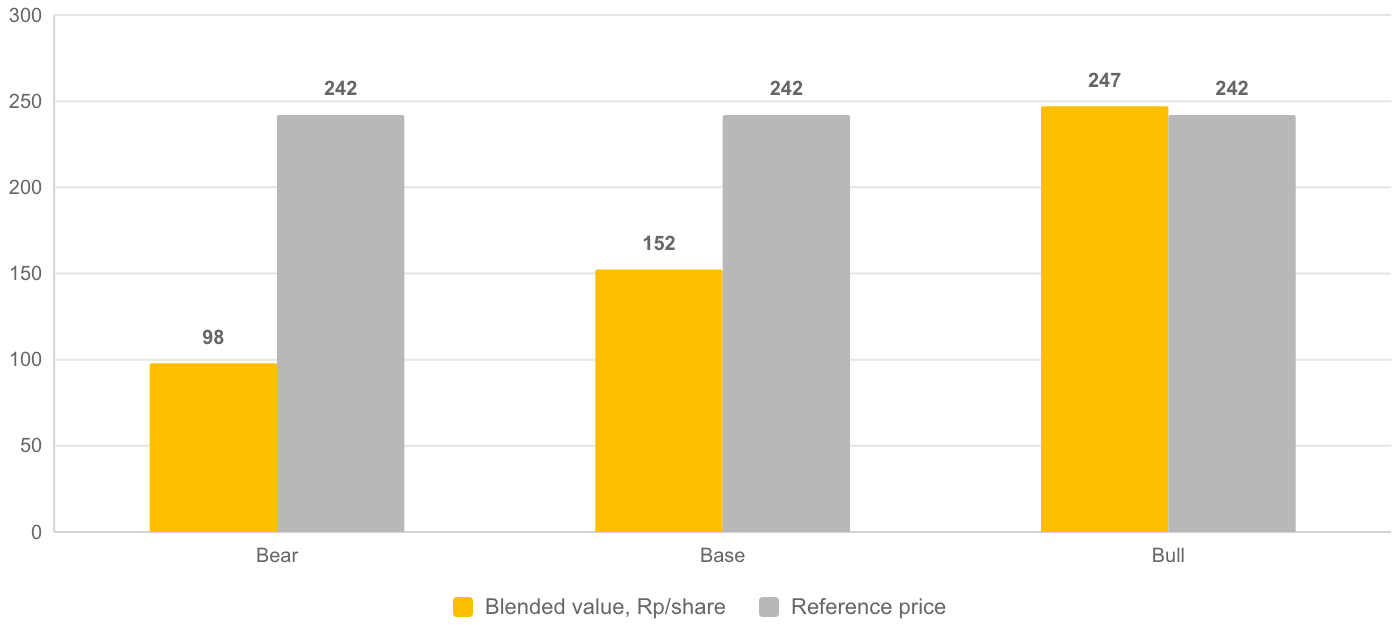

Method	Score	Weight	What drives the score
DCF	52.4	43.9%	Source quality, forecast visibility, terminal-value reliance
Relative	67.0	56.1%	Peer quality, peer count and multiple dispersion

Each weight equals its score divided by the sum of the two scores. The rules adapt when inputs change. They are disclosed analyst judgments, not trained predictions or probabilities of correctness.

43.9% × Rp79.8 + 56.1% × Rp209.1 ≈ Rp152.3/share. The exact calculation uses unrounded weights and values.

Source: engine.py assess(). DCF criteria weights: 40% / 30% / 30%; relative criteria: 40% / 30% / 30%, respectively.

Only the Bull scenario exceeds the reference price

Scenarios vary growth, margins, reinvestment and asset recovery together. The Rp97.9–247.1 range shows dependence on future conditions. Bull exceeds Rp242 by only about 2.1%.

Assumed probabilities of 25% Bear, 50% Base and 25% Bull give a weighted value of Rp162.4/share. These probabilities express analyst judgment, not measured event frequencies.

Source: saved scenario outputs in results.json. Values shown in charts may round to whole rupiah. Scenario weights differ from method weights on slide 13.

A higher discount rate reduces Base DCF value

WACC / terminal growth	2.0%	3.0%	3.5%	4.0%
10%	161.4	173.1	180.2	188.4
12%	110.6	115.3	118.0	120.9
14%	77.2	78.9	79.8	80.7
16%	53.6	53.9	54.1	54.2
18%	36.2	35.9	35.6	35.3

Values are DCF rupiah per share, with other Base inputs fixed. At 3.5% growth, increasing WACC from 12% to 16% lowers value from Rp118.0 to Rp54.1. The central Base cell is Rp79.8 at 14% WACC.

Growth also requires reinvestment. With terminal ROIC fixed at 15%, higher growth can reduce value when the cost of capital exceeds that return.

Source: results.json sensitivity grid. Sensitivity isolates parameter effects; scenarios change several assumptions together.

Confidence 34/100 limits the strength of the conclusion

Why the score is low

The DCF and relative values differ substantially. Peer multiples are dispersed, net diluted shares remain unverified, and mine economics are unavailable.

The model penalizes method disagreement and unresolved data. A score of 34/100 does not mean a 34% probability that the value is correct.

What simulation shows

P10 Rp26.1
P50 Rp71.4
P90 Rp122.1

These DCF percentiles come from 2,000 assumption draws. They describe the chosen simulation, not a statistical confidence interval for future share prices.

Source: assess() and monte_carlo(), seed 42. Confidence = weighted suitability − disagreement penalty (up to 20) − unresolved-data penalty (10), bounded 0–100.

The recommendation is conditional on the evidence

PROVISIONAL AVOID / REDUCE

The Base estimate is 37.1% below the reference price. VISTA labels a gap below −20% as AVOID / REDUCE and adds PROVISIONAL when confidence is below 60. These are disclosed model rules.

What could support higher value

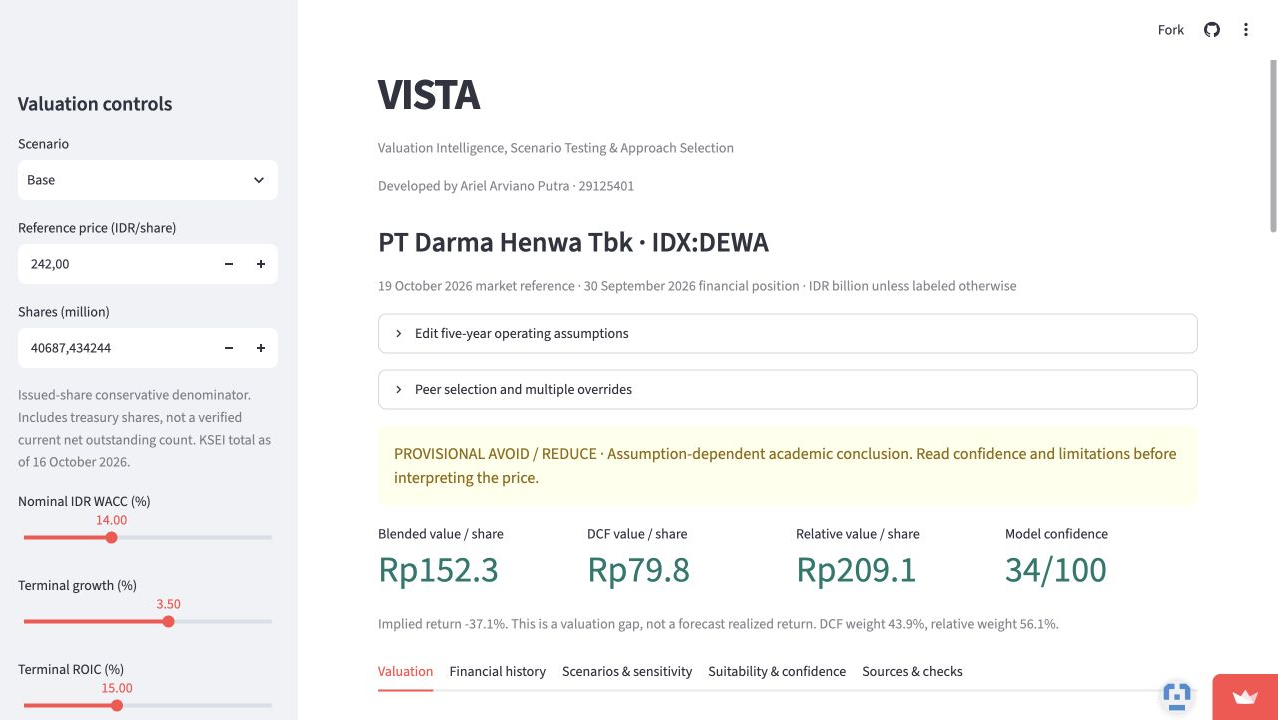

Verified project cash flows, sustained margins, lower capital requirements and evidence that investment assets can be recovered.

What needs verification

Treasury-adjusted diluted shares, matched peer EV/EBITDA, lease commitments, project funding and tax effects.

Source: engine.py recommendation rules and model limitations. This is an assumption-dependent academic conclusion, not a guaranteed investment outcome.

The application and files make the work traceable

App: change assumptions and inspect results.

Excel: follow formulas and scenario calculations.

Report: read the method and limitations.
