PT Darma Henwa Tbk / IDX:DEWA

Digital Business Valuation Midterm
15 content slides, references and supporting appendices

vista-ariel-dewa.streamlit.app

Market reference: 19 October 2026 Financial position: 30 September 2026

Ariel Arviano Putra / 29125401

Company overview and valuation purpose

A capital-intensive mining contractor

Darma Henwa provides mining services. Contract volumes, equipment productivity and operating costs drive service earnings. Equipment replacement and working capital determine how much earnings become cash.

Valuation question	Submitted conclusion
What is equity worth under explicit assumptions?	Base blended estimate: Rp152.3/share
How does that compare with the market?	Rp242/share reference, a 37.1% valuation gap
How strong is the recommendation?	PROVISIONAL AVOID / REDUCE; confidence 34/100

Sources: FY2025 audited statements, business and revenue notes; VISTA Base output. FY2025 related-party revenue is 95.49%, adding concentration risk. Values are academic estimates.

Data sources, valuation date and historical performance

Period	Revenue	Reported Profit	Normalized EBIT
FY2024 restated	6,032.0	55.2	184.6
FY2025 audited	6,392.8	4,306.8	722.3
Q1 YTD 2026	1,549.3	92.7	192.7
Q2 YTD 2026 corrected	3,206.1	354.2	407.6
Q3 YTD 2026	5,102.0	513.1	710.1

Four supplied filings anchor the financial data. Interim figures are cumulative, so nine-month revenue cannot be compared directly with a full year. The corrected Q2 replaces the earlier version.

IDR bn. Market reference: 19 Oct 2026; financial position: 30 Sep 2026; shares: KSEI 16 Oct 2026. The source register maps 187 inputs to files, physical pages and units.

Normalization removes the acquisition-gain distortion

Recurring operations

FY2025 reported net profit is Rp4,306.8bn and includes a Rp4,535.4bn acquisition gain. VISTA starts with revenue less operating costs, SG&A and final tax, giving normalized EBIT of Rp722.3bn.

This construction excludes the gain once. The forecast does not repeat it or deduct it again.

Restated comparisons

The FY2024 restatement reduces assets and equity by Rp272.1bn and increases net profit by Rp38.9bn. Restated data provide the comparison base.

The 2026 interim statements reclassify Rp2,110.0bn within opening 2025 equity. Total equity and cash do not increase.

Sources: FY2025 audited PDF pp.29, 73–81, 120; Q3 PDF pp.22–23. “Final tax” is retained as an operating charge in normalized EBIT; normalized income tax is applied separately.

Model structure and update workflow

Layer	Role and update action
Inputs	JSON stores history, market data, peers, sources and dates. Download, edit and import the template.
Assumptions	Edit scenarios, WACC, growth, ROIC and recovery rates. Financial inputs remain separate from formulas.
Calculation engine	Python normalizes earnings, recalculates DCF and relative values, scores methods and reconciles equity.
Outputs and validation	Refresh results, scenarios and recommendation. Export JSON/CSV and active inputs. Failed imports retain prior data.

The public Streamlit app and local source package use the same engine. Uploaded data are session-only. Fixed PDFs and Excel remain the submitted case and require a separate refresh after a data update.

Implementation: app.py, engine.py and model_io.py. Imports validate schema, units, dates, finite inputs, peer multiples, terminal conditions and financial reconciliations. Setup and workflow: User Guide.

Observed market valuation sets the comparison point

Metric at the stated market reference	Value	Interpretation
Share price	Rp242	Observed reference, no live price feed
Market capitalization	Rp9,846.4bn	Price × issued shares
Observed enterprise value	Rp15,393.3bn	Market cap + debt + NCI − cash
Observed EV / annualized EBITDA	7.42×	Before separating nonoperating assets
Price / parent book equity	1.19×	Market cap ÷ parent equity

The denominator is 40,687.434 million issued shares, including treasury shares. These market ratios are comparison metrics. They receive no weight in the estimated fair value.

Sources: Stock Analysis DEWA history, KSEI register and Q3 filing; formula calculations use unrounded inputs. EBITDA annualizes 9M2026 by 4/3, creating a timing limitation.

Business drivers and Base forecast assumptions

Driver	F1	F2	F3	F4	F5
Revenue Growth	8%	7%	6%	5%	4%
EBIT Margin	14%	14.5%	15%	15%	15%
Cash CapEx / Revenue	21%	20%	19%	18%	17%
D&A / Revenue	15.5%	15%	14.5%	14%	14%
NWC / Revenue	12%	12%	12%	12%	12%

Contract activity supports growth; utilization and cost control support margins. Lower CapEx assumes a gradual normalization in equipment investment. This is optimistic versus 26.3% cash CapEx / sales in 9M2026.

Base: WACC 14%, tax 22%, terminal growth 3.5%, terminal ROIC 15%, additional lease CapEx 0.5% of sales.

Analyst assumptions, not management guidance. F1–F5 end Sep 2027–2031. Starting revenue = 9M2026 × 4/3 = Rp6,802.7bn. Sources: model inputs; Q3 PDF pp.27, 46, 50.

DCF methodology: free cash flow to the firm

Calculation	Economic meaning
FCFF = EBIT × (1 − tax) + D&A − CapEx − ΔNWC	Cash available to all capital providers after investment
Operating EV = PV of F1–F5 FCFF + PV of terminal value	Discount nominal IDR cash flows at nominal IDR WACC
Terminal FCFF = next-year NOPAT × (1 − g / ROIC)	Funds growth through explicit terminal reinvestment
Terminal value = terminal FCFF ÷ (WACC − g)	Requires WACC > g and terminal ROIC > g

At g = 3.5% and ROIC = 15%, terminal reinvestment uses 23.3% of NOPAT. Terminal PV contributes 72.0% of operating EV, so long-term assumptions have a large effect.

Source: engine.py dcf(). CapEx includes cash spending plus lease/noncash replacement allowance. End-year discounting; no 19-day stub adjustment. Detailed FCFF appears in Appendix A.

DCF results and the enterprise-to-equity bridge

Base bridge	IDR bn
Operating Enterprise Value	5,803.8
Less Debt	(6,276.6)
Add Cash	744.9
Add Recoverable Investments	1,269.2
Add Exploration Recovery	1,720.4
Less Noncontrolling Interests	(15.2)
Equity Value	3,246.5

Rp79.8 per share

Equity value × 1,000 ÷ 40,687.434 million shares. Debt and cash enter once. Negative equity receives a zero floor for per-share presentation.

Recoveries: investments 90%; exploration 30% of net carrying value after acquisition deferred tax. Mine economics remain unverified.

Source: Base model and Q3 balance sheet. Exploration recovery is an asset assumption rather than an independent reserve-based NAV. Rounded bridge components may not sum exactly.

Relative valuation: peer median implies Rp209.1

Peer	EV / EBITDA	Business fit and limitation
PTRO	12.74×	Mining contractor; EPC and offshore mix
MYOH	0.80×	Coal services; net cash lowers EV
DOID	7.91×	Mining contractor; leverage and foreign exposure
UNIQ	2.76×	Mining and rental; smaller scale
UNTR	3.73×	Diversified; excluded from the core median

Core median = (2.76 + 7.91) ÷ 2 = 5.335×. Apply to normalized annualized EBITDA of Rp2,073.8bn: EV Rp11,063.9bn. The same equity bridge gives Rp8,506.6bn equity, or Rp209.1/share.

Sources: peer market snapshots and company profiles in the input register. Vendor TTM earnings, leases and one-offs are not fully harmonized with DEWA annualized earnings. P/E is distorted by the acquisition gain.

Approach selection reflects suitability and uncertainty

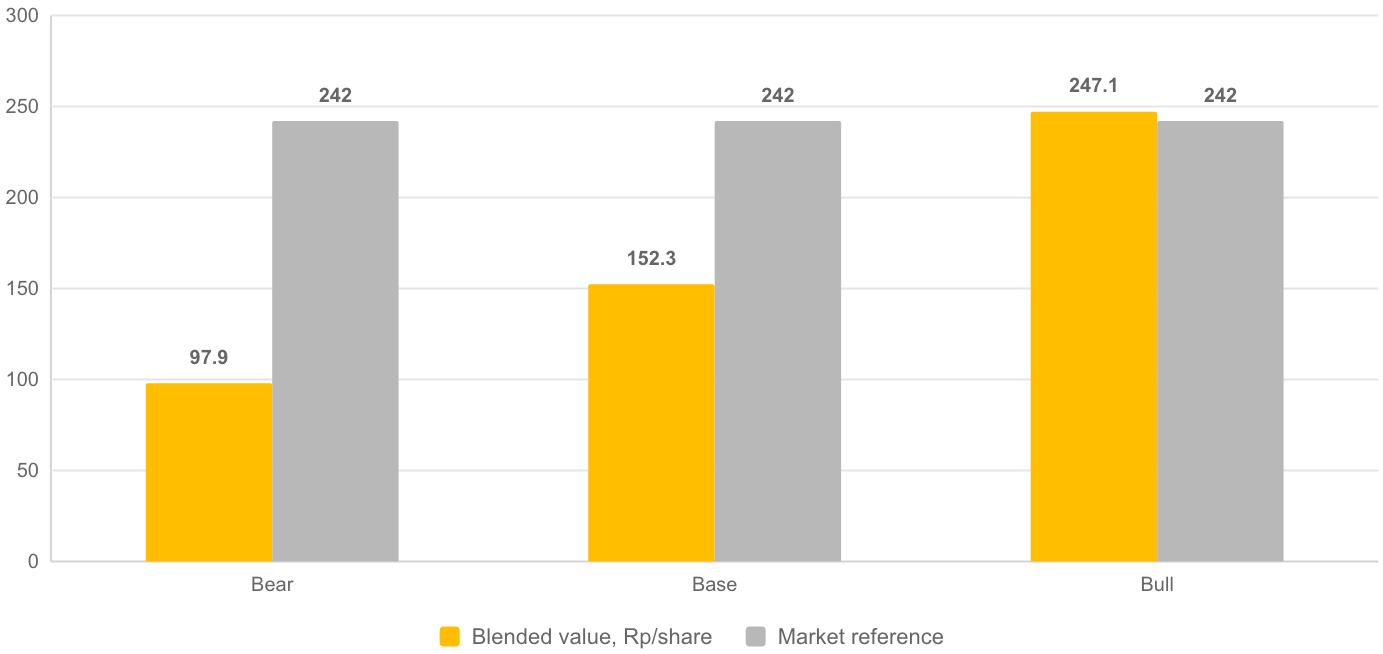

Method	Score	Weight	Quantitative criteria
DCF	52.4	43.9%	Source quality, forecast visibility, explicit-period value
Relative	67.0	56.1%	Peer quality, coverage, inverse dispersion
Asset diagnostic	55.0	0%	Source quality and asset observability

Mining services support FCFF and contractor peers. Existing operations support a going-concern model, while growth and equipment needs weaken cash-flow visibility. Debt and leases require an EV-to-equity bridge.

Each blend weight = method score ÷ combined DCF and relative scores. Better forecast visibility raises DCF emphasis; stronger peer comparability raises relative emphasis. Industry judgments inform scores rather than an automated industry classifier.

Source: assess(). Scores are disclosed judgments, not trained predictions. Financial-sector valuation rules do not apply to this nonfinancial contractor. No independent mine NAV supports an asset-method blend.

Scenarios define an assumption-dependent value range

Rp97.9–247.1 per share

Scenarios jointly change growth, margins, investment and asset recovery. This is a conditional range, not a statistical interval.

Only Bull exceeds Rp242, by about 2.1%. Base remains the central operating case.

Assumed probabilities: Bear 25%, Base 50%, Bull 25%. Weighted scenario value: Rp162.4/share.

Source: saved scenario outputs. Probability assumptions express analyst judgment. Scenario probabilities differ from the method weights used within each scenario.

Sensitivity separates discount-rate and growth effects

WACC / Terminal Growth	2.0%	3.0%	3.5%	4.0%
10%	161.4	173.1	180.2	188.4
12%	110.6	115.3	118.0	120.9
14%	77.2	78.9	79.8	80.7
16%	53.6	53.9	54.1	54.2
18%	36.2	35.9	35.6	35.3

DCF value at 3.5% growth falls from Rp118.0 to Rp54.1 when WACC rises from 12% to 16%. Base is Rp79.8 at 14% WACC. These are DCF values, not blended values.

Growth also needs reinvestment. When WACC exceeds terminal ROIC, more growth can reduce value.

Source: sensitivity() with other Base inputs fixed. Appendix B shows the 2,000-draw assumption simulation and confidence rules. Neither analysis is an empirical forecast of the share price.

Reconciliation and investment recommendation

Result	Rp/share	Interpretation
DCF	79.8	Cash investment and financing obligations constrain equity
Relative	209.1	Peer earnings multiples imply a higher operating EV
Blended Base	152.3	43.9% DCF + 56.1% relative, using unrounded values
Market Reference	242.0	Blended value is 37.1% below the reference price

PROVISIONAL AVOID / REDUCE

The rule signals AVOID / REDUCE below −20% upside, BUY CANDIDATE above +20%, otherwise WATCH / HOLD. Confidence below 60 adds PROVISIONAL. Confidence is 34/100; verify shares, peer comparability and asset recovery before acting.

Sources: assess() and Base results. Central estimate Rp152.3; scenario range Rp97.9–247.1. Higher sustainable margins, lower reinvestment needs or verified asset proceeds could improve value.

Validation evidence and remaining limitations

Checks completed

24 automated engine/import tests cover cash-flow arithmetic, scaling, scenarios, terminal constraints, invalid inputs and reconciliations. Browser and Streamlit checks cover controls and downloads.

Excel agrees with Python for all three cases and 25 sensitivity cells. Testing used the authoring engine; desktop Excel execution was not automated.

Limits that affect the conclusion

Exact net diluted shares, matched peer earnings, lease/vendor commitments and mine economics remain unverified. Terminal value supplies 72% of DCF operating EV.

The 9M annualization can miss seasonality. WACC and recovery rates are assumptions. Updated app inputs do not automatically rewrite fixed Excel/PDF outputs.

Evidence: test_engine.py, test_import.py, Streamlit regression and VALIDATION.md. The checks establish internal consistency; source completeness and forecast accuracy remain separate questions.

AI disclosure, corrections and student responsibility

Disclosure	Scope
Tools used	OpenAI ChatGPT and Codex assisted model development and documentation.
AI-supported tasks	Data extraction, Python coding, workbook formulas, analysis drafting, slide design and documentation.
How outputs were checked	Financial reconciliations, source-page review, independent FCFF checks, Excel/Python comparison and app tests.
Corrections and limitations	Corrected a Q1 prior-year column reading and missing-PPTX download error. AI output still requires source and assumption review.

VISTA combines one-off normalization, adaptive method weights and confidence penalties in a reusable application. Ariel remains responsible for the submitted inputs, calculations and conclusions and for explaining the model independently.

Disclosure reflects the development record. AI assistance does not independently verify market data or certify an investment recommendation. Source and validation files accompany the submission.

References and evidence register

Financial filings

FY2025 audited consolidated statements; Q1 2026; corrected Q2 2026; Q3 2026. Physical page locators and original units appear in source_inputs.csv and the methodological report. Original PDFs accompany the project ZIP.

Appendix A: Base cash-flow calculation

IDR bn	F1	F2	F3	F4	F5
Revenue	7,346.9	7,861.2	8,332.9	8,749.5	9,099.5
EBIT	1,028.6	1,139.9	1,249.9	1,312.4	1,364.9
NOPAT	802.3	889.1	974.9	1,023.7	1,064.6
D&A	1,138.8	1,179.2	1,208.3	1,224.9	1,273.9
Cash + Lease CapEx	1,579.6	1,611.5	1,624.9	1,618.7	1,592.4
Change in NWC	49.7	61.7	56.6	50.0	42.0
FCFF	311.8	395.0	501.7	580.0	704.2
PV of FCFF	273.5	304.0	338.6	343.4	365.7

Source: unrounded engine results. F1–F5 end Sep 2027–2031. PV of explicit FCFF plus Rp4,178.6bn terminal PV equals Rp5,803.8bn operating EV. Full formulas appear in the workbook.

Appendix B: Weighting, confidence and simulation

DCF score = 100 × [40% source quality + 30% forecast visibility + 30% explicit-period EV share]. Relative score = 100 × [40% peer quality + 30% coverage + 30% / (1 + multiple dispersion)]. Coverage caps at four peers.

Confidence = weighted method score − disagreement penalty (up to 20) − unresolved-data penalty (10), bounded 0–100. The Base score is 33.6, displayed as 34. It is not a probability of correctness.

DCF simulation: P10 Rp26.1 P50 Rp71.4 P90 Rp122.1

2,000 independent triangular draws, seed 42. Ranges vary WACC, growth, margins, CapEx and exploration recovery. The simulation always starts from saved Base assumptions, not the active slider scenario.

Source: assess() and monte_carlo(). Full distributions appear in the report. Independent draws omit real-world correlations. The simulation describes assumed inputs, not statistical price confidence.

Appendix C: Access, updates and submission files

vista-ariel-dewa.streamlit.app

Use	Instructions
Open and inspect	No login required. Review Base, change assumptions, inspect Sources & Checks and download results.
Update the dataset	Download model JSON, edit history/market inputs and citations, validate and apply. Save active inputs to retain changes.
Run locally	Python 3.12: install requirements, then run python -m streamlit run app.py. Source files and guide are in the ZIP.
Submit to the portal	PPTX report, executable source ZIP, User Guide and Excel support. PDF is the reading copy. PPTX need not be public.

Access and revision date: 25 Oct 2026. Public hosting needs internet and may sleep. First local setup needs internet; no paid data subscription or API key is required. Follow the User Guide.
